

WEEK 1 – PHISHING AWARENESS ANALYSIS

Introduction

Phishing is a cyber attack technique where attackers attempt to steal sensitive information such as passwords, banking details, OTPs, and personal data by pretending to be trusted organizations or individuals.

Phishing attacks commonly use:

- Fake emails
- Malicious links
- Fake login pages
- Social engineering
- Urgency messages
- Fraudulent websites

Objective

The objective of this project was to analyze phishing attacks and identify suspicious indicators in emails and messages.

Key Requirements

- Identify suspicious links
- Detect phishing keywords
- Analyze malicious communication
- Identify phishing red flags
- Understand social engineering attacks

Red Flags Identified

1. Sender-domain mismatch
2. Fake urgent messages
3. Suspicious attachments
4. Fake login websites
5. Requests for passwords or OTPs
6. Threatening language
7. QR code phishing
8. Fake technical support scams
9. Authority-based manipulation
10. Fear-based messaging

Why Phishing Messages Are Unsafe

Phishing attacks can:

- Steal passwords
- Leak confidential data
- Install malware
- Cause financial fraud
- Compromise organizational systems

Prevention Methods

- Verify sender email addresses
- Avoid suspicious links
- Use multi-factor authentication
- Report phishing messages
- Never share passwords through email
- Verify URLs before login

Code

Input

```
password = input("Enter Password: ")

if len(password) >= 8:
    print("Strong Password")
else:
    print("Weak Password")

print("Password Analysis Completed")
```

output

```
Enter Password: Weak Password
Password Analysis Completed
```
