

WEEK 4 – LAPTOP SECURITY AUDIT

Introduction

A laptop security audit verifies whether a computer system follows proper cybersecurity protection standards.

Objective

The objective was to analyze laptop security settings and identify vulnerabilities.

Security Checks Performed

- Firewall verification
- Disk encryption verification
- Software update analysis
- Admin account checking
- Guest account verification

Vulnerabilities Found

- Delayed updates
- Weak authentication methods
- Guest account enabled
- Missing endpoint protection

Remediation Actions

- Updated operating system
- Enabled firewall
- Verified encryption
- Disabled guest account
- Improved authentication settings

Code

Input

```
firewall = input("Is Firewall Enabled? (yes/no): ")
antivirus = input("Is Antivirus Updated? (yes/no): ")
```

```
if firewall == "yes" and antivirus == "yes":
    print("System Secure")
else:
    print("Security Risk Detected")
```

```
print("Security Verification Completed")
```

Output

```
Is Firewall Enabled? (yes/no): Is  
Antivirus Updated? (yes/no): System  
Secure  
Security Verification Completed
```
